

The Steam Carriage Build Order

A two page model. After clear-coating, I always start with the large fold-over parts. In this case, the wheels, back rail, axles (keeping the grey attachment points free of glue), the bench ends, and the smokestack cap. That way the parts can thoroughly dry while being pressed (I usually stick them in an old phone book and pile others on top)

Here is a change from my build. There are now reinforcing plates that get glued to the red undercarriage extensions where they join the body. I then cut out the windows and glue the extra windows behind. This assembly will then be pressed while drying.
