

U.S.S. LEXINGTON NCC-1709

CONSTITUTION CLASS CRUISER

Build the base and flight stand first.

Then build the side elevation, glueing the upper end of the flight stand into the lower part of the engineering hull.

Build the warp nacelles and glue them to the appropriate spots on the engineering hull. When the glue has set, bend the pylons out and the nacelles upright.

Finally, build the saucer section and slide it into place.

To store this mini folded flat, remove the saucer section and the base. Fold the pylons of the warp nacelles up. That's it.
