

USS BELLEROPHON NCC-74705

INTREPID CLASS EXPLORATION VESSEL

ASSEMBLY INSTRUCTIONS

Start with building the base and the side elevation. Then build the engineering hull with the warp nacelles. So far, so easy...

The saucer section is a little bit tricky to build. Cut the element out along the black border, then precisely cut along the rear and the insides of the tail of the upper part of the saucer. Score and fold up the white glue flaps of the underside. Cut along the blue cutline and insert the saucer into the side elevation. Fold the top over and glue it to the flaps. Finally bring the tail sections to the middle and glue them to the according places on the upper side of the engineering hull.

You should now have a 2.5D ship with nicely rounded 3D-ish saucer section.

!!!! This ship can not be stored folded flat !!!!
