Side Of
This End

SkuhdFooze Mk II ("Deathtrap") L6/11 Semovente

The SkuhdFooze Mk II is the cheapest AFV to be had from SkuhdFooze, purveyor of arms and mercenaries throughout the galaxy. The original name is "Grasp of Doom," or "Clutch of Doom," but poor translations have led to the vehicle's popular nickname, the SkuhdFooze Deathtrap. The Mk II's armor is strong enough to withstand most man-portable weapons, but it is nowhere near as strong as the KV-12T Lev.

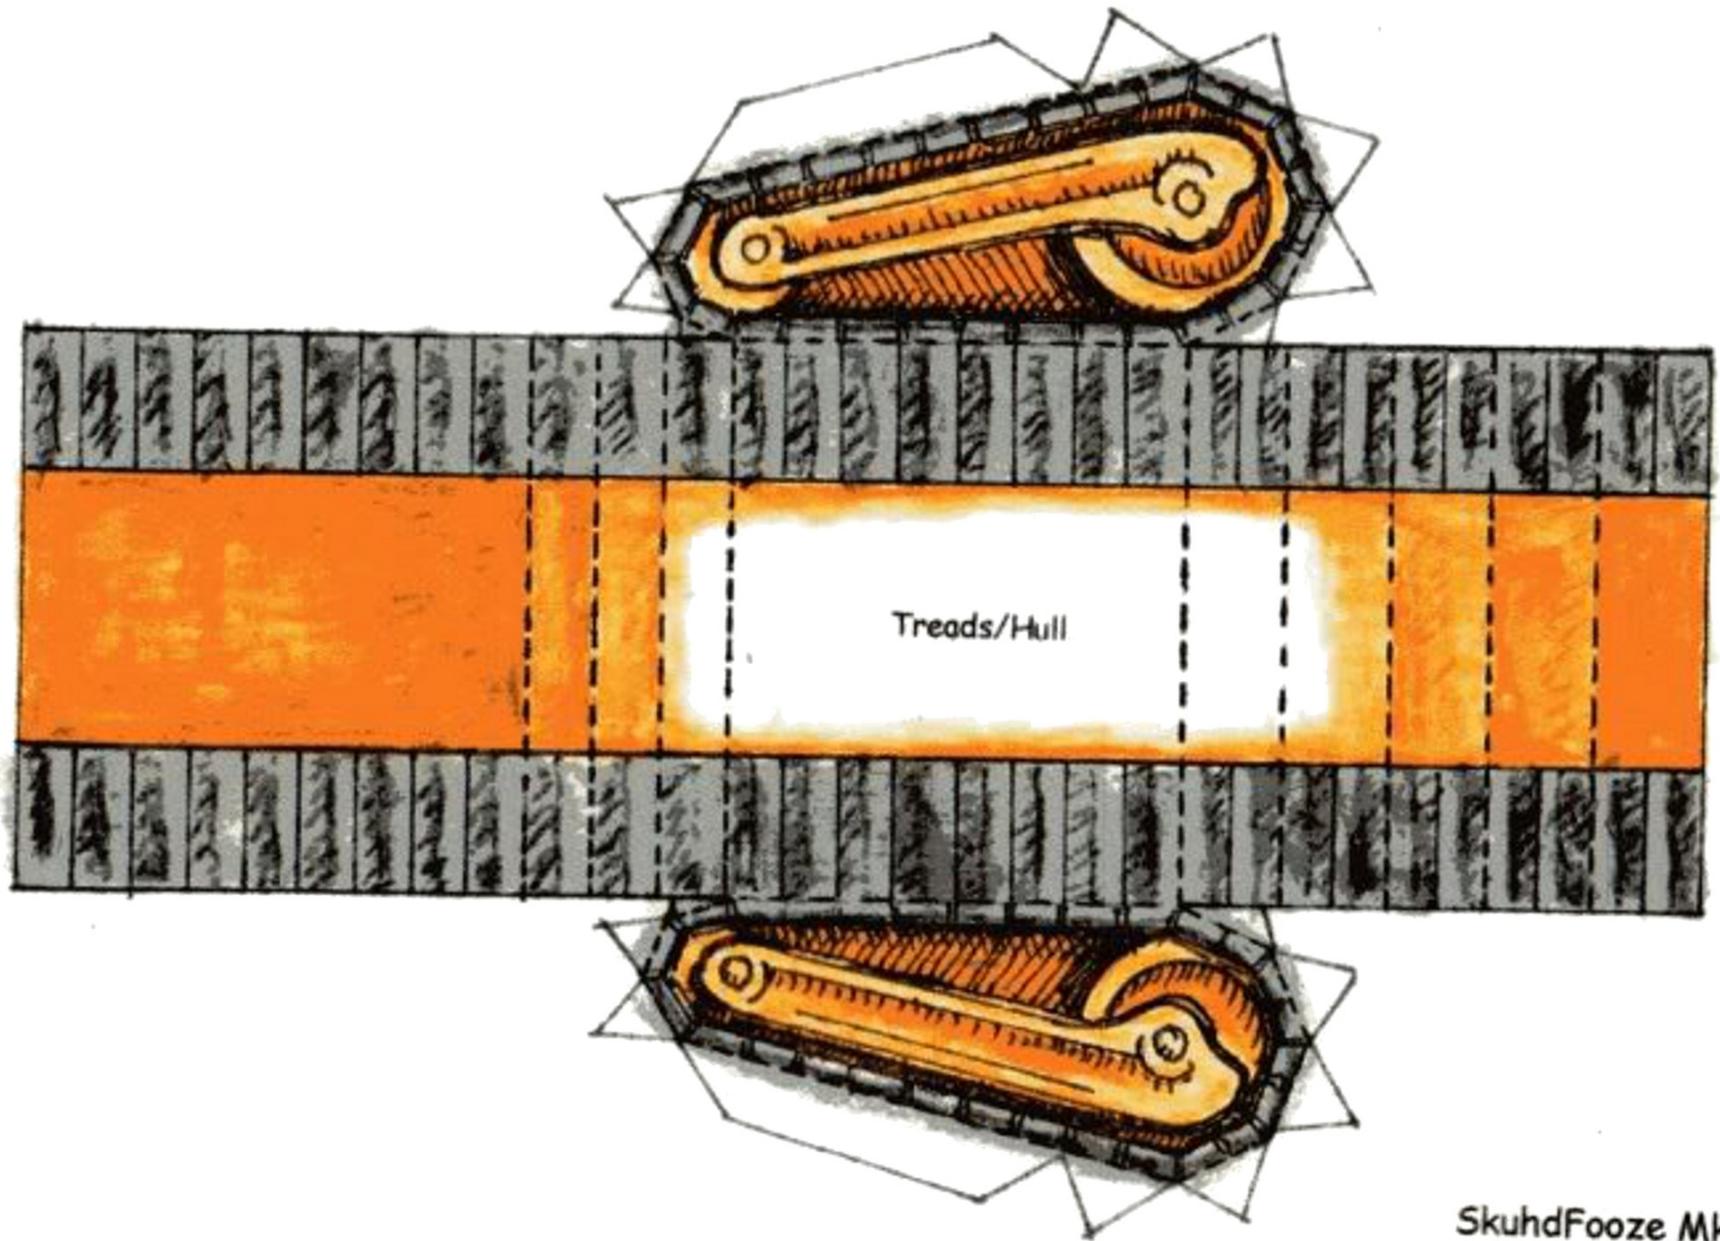

1. Cut on solid outlines, score and fold on dotted lines. Test fit your pieces before gluing.
2. Glue the curved ends of the treads/hull piece first, then glue the bottom flap. It should overlap at the forward end.
3. After gluing the sides of the superstructure together, fold the side glue flaps under, and the end flaps out, then glue the superstructure to the top of the treads/hull piece.
4. Blacken the back side of the main gun barrel piece on the end opposite the vehicle color. Wrap the main gun barrel piece around a 5/16ths dowel. If you don't have a dowel, a regular pencil, a cheap ballpoint stick pen, or the handle of a #1 light-duty hobby knife will do. Be sure to keep the edges even. Start with the black side against the dowel, and when you're finished wrapping, and you slide the tube off the dowel, it should be black on the inside and the vehicle color on the outside. When you're ready, put some glue on the inside of the very tip of the colored end, and press until it sets. Slip the tube off the dowel. Use white glue to stick the tube to the main gun mantlet. When the white glue is dry, glue the mantlet to the forward slope of the superstructure.
